RE: Traffic Assessment, Highland Batch Plant, US Route 9W, Town of Lloyd, Ulster County, New York; CM Project No. R251377.00

Dear Mr. Clemente:

Creighton Manning Engineering & Surveying, PLLC (CM) has conducted a traffic assessment for the construction of a proposed batch concrete plant development located 3260 Route 9W in the Hamlet of Highland. This assessment is based on information provided in the "Site Plan" prepared by *Control Point Associates, Inc. PC*, dated April 18, 2025 (see Attachment A).

1.0 Project Description and Existing Conditions

The project consists of the construction of various manufacturing structures including the main concrete batch plant building, a conveyor, and material bins on the east side of US Route 9W. The construction season occurs from March 15th to December 15th. The facility will be open from approximately 5:00 a.m. to 6:00 p.m. during the week and from 6:00 a.m. to 1:00 p.m. on Saturday. The existing parcel currently accommodates the *Aldo's Automotive Precision Machine Ltd* business one fabrication building. Access to the parcel is currently provided via two curb cuts located approximately 0.55 miles north of the US Route 9W/Red Top Road/N. Riverside Road intersection. It is anticipated that the proposed development will be fully built and occupied by 2026. The project location is shown on Figure 1.

US Route 9W is classified as an urban principal arterial other adjacent to the project site that is on the National Highway System (NHS). This roadway includes two, 11-foot wide travel lanes in each direction, an 8-foot wide median with a guiderail, and 4 to 6-foot wide paved shoulders. US Route 9W travels in a north-south direction through the Town of Llyod. The posted speed limit is 55-mph near the site and land uses along the roadway generally consist of other manufacturing/warehousing uses and commercial uses.

A review of the existing curb cuts on US Route 9W indicates that only right-turns in and out are permitted due to the median and guiderail; however, a review of US Route 9W indicates that there are "turnarounds" located approximately 2,850-feet north and 750-feet south of the site as shown on Figure 2 and Figure 3. Vehicles traveling south on US Route 9W that want to turn left into the site would pass the facility and use the

Figure 1 – Project Location

“Southern Turnaround” to make a U-turn in order to make a right-turn into the batch plant. In addition, vehicles that want to travel south on US Route 9W from the batch plant will make a right-turn from the site and use the “Northern Turnaround” in order to make a U-turn.

Automatic traffic recorder (ATR) data was collected on US Route 9W near the turnaround locations from Friday, September 6, 2025 through Thursday, September 18, 2025. The data indicates that on a typical weekday, US Route 9W currently serves approximately 6,280 vehicles per day (vpd) in the northbound direction and 6,245 vpd in the southbound direction. By comparison, US Route 9W serves approximately 5,400 vpd in the northbound direction and 5,370 vpd in the southbound direction on Saturday. In addition, an 85th percentile speed of 65-mph was recorded in the northbound direction while an 85th percentile speed of 62-mph was recorded in the southbound direction. Available gap data was also observed in both directions near the turnarounds. The raw traffic data is included under Attachment B.

Figure 2 – Northern Turnaround

Figure 3 – Southern Turnaround

2.0 Traffic Forecasts & Assessment

Site Generated Traffic

Trip generation determines the quantity of traffic expected to travel to/from a given site. The Institute of Transportation Engineers (ITE) *Trip Generation*, 12th edition, is the industry standard used for estimating trip generation for proposed land uses based on data collected at similar uses; however, given the unique nature of this development, site specific trip generation rates have been calculated based on counts at a similar existing batch plant located in the Town of Wilton, New York that is operated by the same Applicant. Table 1 summarizes operational information provided by the Applicant that reflects the maximum daily trips that could be generated by the existing *Wilton Bonded Concrete* plant and the proposed *Highland Batch Plant*.

Table 1– Daily Trip Generation Summary (Maximum Operations) – Estimated Trips provided by Applicant

Trip Type	Existing Wilton Bonded Concrete Daily Trips			Anticipated Highland Batch Plant Daily Trips			+%
	Enter	Exit	Total	Enter	Exit	Total	
Front Discharge Mixers							
- 8 mixer trucks for Wilton-5 daily trips each	40	40	80	30	30	60	-20%
- 6 mixer trucks for Highland-5 daily trips each							
Cement Deliveries (Tractor Trailers)	4	4	8	3	3	6	-25%
Aggregate Deliveries	13	13	26	11	11	22	-15%
Employees							
- 8 mixer drivers and 2 plant operators for Wilton	10	10	20	8	8	16	-20%
- 6 mixer drivers and 2 plant operators for Highland							
Miscellaneous Deliveries (Amazon, etc.)	2	2	4	2	2	4	0%
Total	69	69	138	54	54	108	-22%

Table 1 indicates that the *Wilton Bonded Concrete* plant can generate a maximum of 138 daily trips while it is anticipated that the proposed *Highland Batch Plant* will generate a maximum of 108 daily trips. This suggests that the proposed development will generate approximately 22% fewer trips over the course of the day compared to the existing concrete plant based on the size of the facilities.

A traffic count conducted at the driveway associated with the *Wilton Bonded Concrete* plant recorded entering and exiting traffic volumes on Tuesday, August 19, 2025. The AM peak hour occurred from 7:00 to 8:00 a.m. while the PM peak hour occurred from 4:00 to 5:00 p.m. The raw traffic data can be found under Attachment C. The count data indicates that this existing batch plant generates 23 trips during the AM peak hour (13 trips entering and 10 trips exiting) and 20 trips during the PM peak hour (9 trips entering and 11 trips exiting). Table 2 summarizes the anticipated AM and PM peak hour trip generation of the proposed *Highland Batch Plant* assuming it generates 22% fewer trips than the existing *Wilton Bonded Concrete* plant.

Table 2 – Highland Batch Plant Peak Hour Trip Generation Summary

Land Use		AM Peak Hour			PM Peak Hour		
		Enter	Exit	Total	Enter	Exit	Total
Proposed Highland Batch Plant	Passenger Cars	5	0	5	1	4	5
	Trucks	5	8	13	6	5	11
Total		10	8	18	7	9	16

The trip generation summary shown in Table 2 indicates that the proposed *Highland Batch Plant* will generate 18 AM peak hour trips and 16 PM peak hour trips if it operates similar to the existing *Wilton Bonded Concrete* plant.

Traffic Volume Conditions

Traffic generated by the proposed project was distributed onto the surrounding roadway network based on existing traffic data and probable travel routes. It is expected that approximately 50 percent of site generated traffic will travel to and from the south via US Route 9W while approximately 50 percent will travel to and from the north via US Route 9W. This distribution of traffic results in a maximum increase in traffic of approximately five (5) new vehicle trips during the AM and PM peak hours on any one approach to an intersection located near the project site.

The magnitude of the new vehicle trips generated by the site is less than the ITE threshold of 50 site-generated vehicles at a single intersection which would trigger the need for detailed intersection analysis as noted in the *Multimodal Transportation Impact Analysis for Site Development* (2023). This guidance was developed as a tool to identify locations where the magnitude of traffic generated has the potential to impact operations at off-site intersections and screen out locations from requiring detailed analysis that do not reach the 50-vehicle threshold and are unlikely to require mitigation. The anticipated traffic volumes for the *Highland Batch Plant* will be below the 50-vehicle threshold, indicating that detailed intersection analysis is not needed and that the site generated traffic will be accommodated by the existing roadway network.

3.0 Sight Distance

A sight distance evaluation was completed at the Site Driveways location on US Route 9W. Available *intersection* sight distance was measured from the perspective of a passenger car/combination truck looking left to exit the site. The available intersection sight distance should provide drivers a sufficient view of the intersecting roadway to allow passenger cars/combination trucks to enter or exit the intersection without excessively slowing vehicles traveling at or near the operating speed on the intersecting mainline.

Stopping sight distance was also measured on US Route 9W at the Site Driveway locations. Stopping sight distance is the length of the roadway ahead that is visible to the driver. The available stopping sight distance on a roadway should be of sufficient length to enable a passenger car/combination truck traveling at or near the operating speed to stop before reaching a stationary object in its path.

The sight distances measured in the field were compared to the guidelines presented in *A Policy on Geometric Design of Highways and Streets, 2018* published by the American Association of State Highway Transportation Officials (AASHTO) and the current New York State Department of Transportation (NYSDOT) design guidance presented in the *Highway Design Manual Chapter 5 and Chapter 7* (Appendix 5C and Exhibit 7-7) for the design speeds on US Route 9W of 65-mph in the northbound direction and 60-mph in the southbound direction. The results of the sight distance analysis are summarized in Table 3.

Table 3 – Sight Distance Summary (feet)

Intersection			Intersection Sight Distance ¹				Stopping Sight Distance ²	
			Right-Turn from Site Driveway (D _L)	Left-Turn from Site Driveway		Left-Turn from US Route 9W (D _S)	SSD _{NB}	SSD _{SB}
				Looking Left (D _L)	Looking Right (D _R)			
US Route 9W/ North Site Driveway	Passenger Car	Available	>1,20	NA	NA	NA	>1,200	NA
		Recommended	625	765	710	575	645	570
	Combination Truck	Available	>1,200	NA	NA	NA	>1,200	NA
		Recommended	1,005	1,170	930	785	645	570
US Route 9W/ South Site Driveway	Passenger Car	Available	>1,100	NA	NA	NA	>1,200	NA
		Recommended	625	765	710	575	645	570
	Combination Truck	Available	>1,200	NA	NA	NA	>1,200	NA
		Recommended	1,005	1,170	930	785	645	570

XXX = Available Sight Distance

¹ Intersection sight distance is measured at 14.5 feet back from the travel way at an object height of 3.5 feet and an eye height of 3.5-feet for a passenger car and 7.5-feet for a combination truck.

² Stopping sight distance measured for a 2-foot object located in the path of northbound and southbound vehicles on US Route 9W at an eye height of 3.5-feet for a passenger car and 7.5-feet for a combination truck.

The intersection and stopping sight distance evaluation for a passenger car and a combination truck at the Site Driveway on US Route 9W indicates that all sight lines meet AASHTO guidelines for the applicable operating speeds. It is recommended that any site signing be placed a minimum of 15-feet back from the travel way (outside the sight triangle) and that the landscaping plan consider sight lines in order to maintain visibility at the Site Driveways.

4.0 Gap Analysis

A gap study was conducted to determine if adequate gaps exist in traffic on US Route 9W to allow passenger cars and trucks to use the turnarounds located north and south of the Site Driveways. This assessment focuses on the Wednesday, September 10, 25 data collected by the ATR as noted above which represents typical mid-week conditions. Gaps were measured in the flow of traffic traveling in both directions on US Route 9W for a typical weekday since volumes are higher during the week when compared to Saturday. The *Highway Capacity Manual* (HCM) provides the duration of critical gaps at an unsignalized intersection. The gaps measured in the field were then compared to the critical gaps required. Below is a summary of the gap study as it relates to the flow of traffic at both turnaround intersections on US Route 9W. It is noted that a “Left-Turn From a Minor Road” is not necessary due to the existing raised median.

Left Turn from US Route 9W onto the Northern and Southern Turnarounds – A minimum gap of 4.1 and 6.1 seconds is required in the flow of southbound traffic for a northbound passenger car and truck on US Route 9W to turn left onto the Turnaround intersections, respectively. It is anticipated that the site will generate a maximum of five (5) vehicles will turn left from US Route 9W to the Turnaround intersections during the peak periods evaluated. Table 4 summarizes the gaps available for left-turn traffic on US Route 9W.

Table 4 – Available Gaps for Left-Turn Traffic from US Route 9W to the Turnarounds

Time	Northern Turnaround				Southern Turnaround			
	Passenger Cars		Trucks		Passenger Cars		Trucks	
	Number of Gaps	Vehicles Serviced	Number of Gaps	Vehicles Serviced	Number of Gaps	Vehicles Serviced	Number of Gaps	Vehicles Serviced
5:00 a.m.- 6:00 a.m.	72	758	68	495	74	748	71	488
6:00 a.m.- 7:00 a.m.	189	1,586	178	1,034	130	1,199	127	790
7:00 a.m.- 8:00 a.m.	160	669	125	395	255	998	200	573
8:00 a.m.- 9:00 a.m.	220	731	148	401	321	1,196	250	678
9:00 a.m.- 10:00 a.m.	206	924	170	540	340	1,341	249	744
10:00 a.m.- 11:00 a.m.	221	963	170	562	296	1,176	214	663
11:00 a.m.- 12:00 p.m.	210	974	154	557	304	1,264	238	722
12:00 p.m. - 1:00 p.m.	164	659	112	383	289	1,175	222	677
1:00 p.m. - 2:00 p.m.	166	726	126	408	328	1,398	268	816
2:00 p.m. - 3:00 p.m.	221	917	163	530	264	1,097	206	625
3:00 p.m. - 4:00 p.m.	235	928	158	528	296	1,203	239	682
4:00 p.m.- 5:00 p.m.	280	1,080	196	599	372	1,496	274	838
5:00 p.m.- 6:00 p.m.	254	950	181	551	295	1,220	231	708

The gap study demonstrates that the available gaps can theoretically accommodate a minimum of 659 passenger cars or 383 trucks at either Turnaround intersection during the peak hours (worst-case). This indicates that the available gaps can accommodate the number of passenger cars/trucks turning left onto the Turnarounds during the peak hours of operation for the batch plant.

Right-Turns from the Northern and Southern Turnarounds onto US Route 9W – A minimum gap of 6.9 to 8.9 seconds is required in the flow of northbound and southbound traffic for a passenger car and truck exiting the Turnaround intersections. to turn right onto US Route 9W, respectively. It is anticipated that a maximum of five (5) vehicles will turn right from the Turnaround intersections during the peak periods evaluated. Table 5 summarizes the gaps available for right-turn exiting traffic.

Table 5 – Available Gaps for Right-Turn Traffic from the Turnarounds on US Route 9W

Time	Northern Turnaround				Southern Turnaround			
	Passenger Cars		Trucks		Passenger Cars		Trucks	
	Number of Gaps	Vehicles Serviced	Number of Gaps	Vehicles Serviced	Number of Gaps	Vehicles Serviced	Number of Gaps	Vehicles Serviced
5:00 a.m.- 6:00 a.m.	63	407	69	315	62	389	66	304
6:00 a.m.- 7:00 a.m.	163	847	167	640	117	630	121	486
7:00 a.m.- 8:00 a.m.	114	343	85	215	187	506	160	329
8:00 a.m.- 9:00 a.m.	130	352	99	215	224	597	167	366
9:00 a.m.- 10:00 a.m.	151	481	123	313	229	664	179	414
10:00 a.m.- 11:00 a.m.	152	498	126	324	189	580	154	373
11:00 a.m.- 12:00 p.m.	150	519	123	333	219	641	177	412
12:00 p.m. - 1:00 p.m.	102	345	84	222	199	593	158	373
1:00 p.m. - 2:00 p.m.	117	371	102	239	254	719	200	454
2:00 p.m. - 3:00 p.m.	146	468	119	305	190	554	158	360
3:00 p.m. - 4:00 p.m.	145	469	111	302	213	610	163	384
4:00 p.m.- 5:00 p.m.	189	550	153	352	245	758	182	470
5:00 p.m.- 6:00 p.m.	163	469	125	294	215	625	169	406

The gap study demonstrates that the available gaps can theoretically accommodate a minimum of 343 passenger cars or 215 trucks at either Turnaround intersections onto US Route 9W during the peak hours (worst-case). The gap study demonstrates that the available gaps can accommodate the number of passenger cars/trucks turning right out of the Turnarounds during the peak hours of operation for the batch plant.

Based on the above analysis, there are an adequate number of available gaps to serve the Turnaround intersections on US Route 9W for all conditions, while providing desirable operating conditions.

5.0 Auto-Turn Assessment

An assessment of the Northern and Southern Turnaround intersections was conducted to ensure that the worst-case design vehicle associated with concrete batch plant operations can negotiate the U-turn movement to head north and south on US Route 9W. Information provided by the Applicant indicates that following trucks will access the site:

- Dump Trucks – 30-feet long
- Legacy and Legacy 2.0 Mixers – 33-feet long
- Cement Deliveries (Tractor Trailers) – 60-feet long
- Aggregate Deliveries (Tractors and Dump Trailers) – 50-feet long

This suggests that the Legacy Mixers and Cement Tractor Trailers represent the largest single unit truck and combination truck that will access the proposed facility, respectively. The Auto-Turn assessment (shown below) indicates that these design vehicles can adequately make the left-turn from US Route 9W to access the turnaround intersections and then can make a right-turn back onto US Route 9W in the opposite direction. Mitigation is not recommended at these intersections.

6.0 Conclusions

The project consists of the construction of various manufacturing structures including the main concrete batch plant building, a conveyor, and material bins on the east side of US Route 9W. The construction season occurs from March 15th to December 15th. The facility will be open from approximately 5:00 a.m. to 6:00 p.m. during the week and from 6:00 a.m. to 1:00 p.m. on Saturday. The existing parcel currently accommodates the Aldo's Automotive Precision Machine Ltd business one fabrication building. Access to the parcel is currently provided via two curb cuts located approximately 0.55 miles north of the US Route 9W/Red Top Road/N. Riverside Road intersection. It is anticipated that the proposed development will be fully built and occupied by 2026. The following is noted regarding the proposed project:

- A review of the existing curb cuts on US Route 9W indicates that only right-turns in and out are permitted due to the median and guiderail; however, a review of US Route 9W indicates that there are "turnarounds" located approximately 2,850-feet north and 750-feet south of the site. Vehicles traveling south on US Route 9W that want to turn left into the site would pass the facility and use the "Southern Turnaround" to make a U-turn in order to make a right-turn into the batch plant. In addition, vehicles that want to travel south on US Route 9W from the batch plant will make a right-turn from the site and use the "Northern Turnaround" in order to make a U-turn.
- The proposed project is expected to generate 18 vehicle trips during the AM peak hour and 16 vehicle trips during the PM peak hour assuming similar operations to the existing *Wilton Bonded Concrete* plant.
- The anticipated traffic volumes for the *Highland Batch Plant* will be below the 50-vehicle threshold outlined by ITE, indicating that detailed intersection analysis is not needed and that the site generated traffic will be accommodated by the existing roadway network.
- The sight distance assessment indicates that adequate intersection and stopping sight distance is provided for a passenger car and a combination truck at the Site Driveway on US Route 9W.
- It is recommended that any site signing be placed a minimum of 15-feet back from the travel way (outside the sight triangle) and that the landscaping plan consider sight lines in order to maintain visibility at the Site Driveway.
- The gap analysis indicates that there are an adequate number of available gaps to serve the Turnaround intersections on US Route 9W for all conditions, while providing desirable operating conditions.
- The Auto-Turn assessment indicates that the worst-case design vehicles can adequately make the left-turn from US Route 9W to access the Northern and Southern Turnaround intersections and then can make a right-turn back onto US Route 9W in the opposite direction. Mitigation is not recommended at these intersections.

If you have any questions, or if we can be of any further service, please do not hesitate to call our office.

Respectfully submitted,
Creighton Manning Engineering & Surveying, PLLC
